

ReceiveRight

Know what arrived. Resolve what didn't.

A mobile-friendly receiving desk for small shops. Keep the invoice, physical counts, supporting evidence, and supplier response together in one record.

ONE COMPLETE WORKFLOW

01**Capture**

Upload the invoice and record the delivery observations.

02**Confirm**

Check counts, price and pack size.
Review the visible calculation.

03**Resolve**

Share a protected link. Record the supplier response to this revision.

A SMALL EXAMPLE WITH A VERIFIABLE RESULT

INVOICE LINE	RECEIVING OBSERVATION	ITEM DISCREPANCY
Water: 12 x INR 100	10 bottles received	2 missing = INR 200
Biscuits: 24 x INR 40	24 received; 2 damaged	2 damaged = INR 80
Tea: 1 carton x INR 1,200	12 individual packets	Confirm 12 per carton

AFTER HUMAN CONFIRMATION

Calculated item value. Tax and discounts excluded.

INR 280

WHAT MAKES THE RECORD USEFUL

Human confirmation

Unknown counts and pack sizes remain unresolved.
Damaged and wrong units are already included in the physical received count.

Evidence and exports

Private uploads, source previews, item photographs, activity history, CSV/JSON, and browser print-to-PDF.

A supplier response that stays attached

A separate PIN protects a revision-specific review. The supplier can acknowledge or dispute each affected item.

An honest outcome

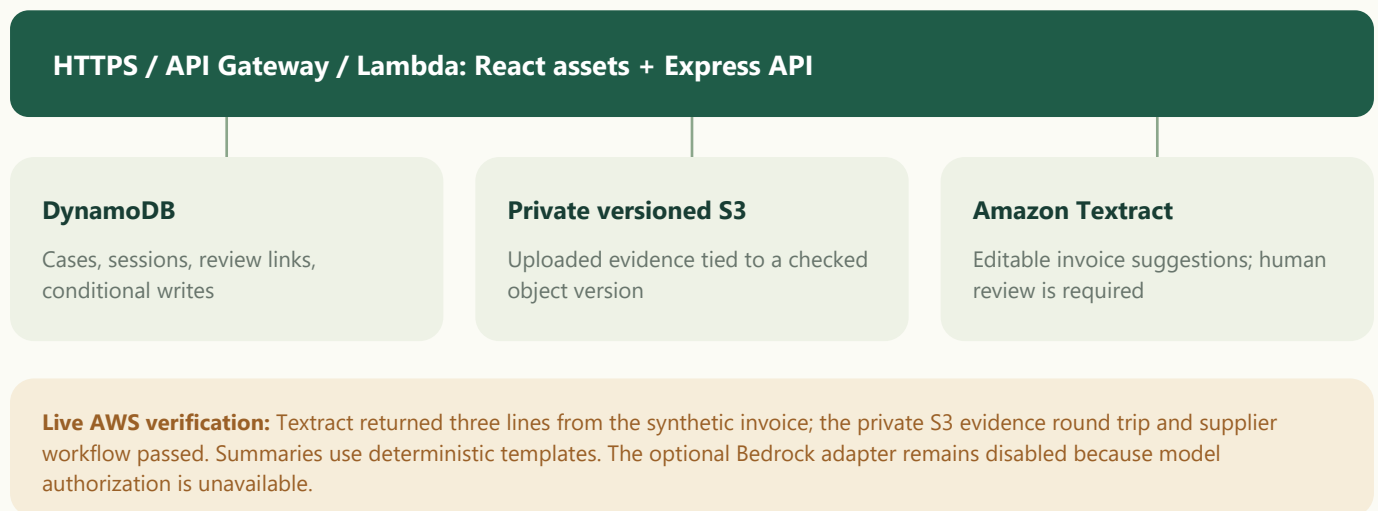

Closing means the discrepancy was acknowledged. It does not claim payment, a refund, or money recovered.

Demo status: synthetic invoice, names and receiving illustration. No real-shop pilot or measured customer outcome is claimed.

Built to keep the evidence honest.

React + TypeScript interface. Express API. Shared deterministic reconciliation. AWS persistence and Textract suggestions with human-confirmed receiving counts.

CURRENT AWS DEPLOYMENT PATH

CHECKS THAT PROTECT THE WORKFLOW

Record consistency. Edits invalidate old supplier invitations. Concurrent writes reject stale changes. Supplier decisions refer to the reviewed revision.

Defined access. Workspace-scoped receiver tokens; 48-hour supplier links; six-digit PINs with lockout; private evidence access. Responder names are self-reported. Browser workspaces have no account recovery.

Automated verification. The 33-test suite covers quantity and money edge cases, the receiver/supplier lifecycle, access boundaries, stale revisions, upload handling and AI-call limits. Software tests do not establish real-world accuracy or impact.
