

ReceiveRight

One shared, versioned delivery record.

For small shops receiving packaged goods. Bring the invoice, physical counts, evidence, and supplier reply into a versioned record both sides can review.

ONE COMPLETE WORKFLOW

01**Capture**

Upload the invoice and record the delivery observations.

02**Confirm**

Check counts, price and pack size.
Review the visible calculation.

03**Review together**

Share a protected link. Preserve the response and reviewed version.

A SMALL EXAMPLE WITH A VERIFIABLE RESULT

INVOICE LINE	RECEIVING OBSERVATION	ITEM DISCREPANCY
Water: 12 x INR 100	10 bottles received	2 missing = INR 200
Biscuits: 24 x INR 40	24 received; 2 damaged	2 damaged = INR 80
Tea: 1 carton x INR 1,200	12 individual packets	Confirm 12 per carton

AFTER HUMAN CONFIRMATION

Calculated item value. Tax and discounts excluded.

INR 280

WHAT MAKES THE RECORD USEFUL

Before sharing

Unknown counts, units and pack sizes stay unresolved.
The receiver confirms the invoice and physical observations.

Return to the record

A privately saved recovery code restores the workspace on another browser. Active sessions can be renewed.

A response to one version

A later edit preserves the old quantities, evidence references and supplier replies in saved history.

A precise outcome

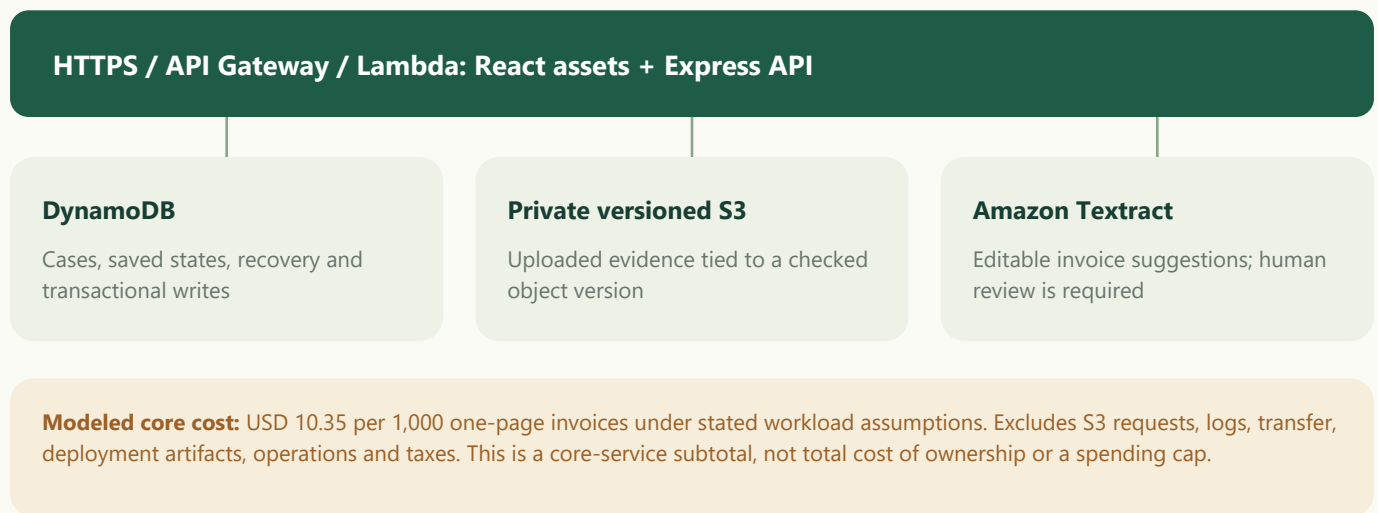

The supplier acknowledges or disputes affected items.
Closure records agreement, not a refund or payment.

Product hypothesis: one shared reference reduces reconstruction across messages. Synthetic demo; a real shop/supplier trial is still pending.

Proof behind the shared record.

React + TypeScript interface. Express API. Shared deterministic reconciliation. Five working AWS integrations. Human-reviewed extraction and retained record history.

CURRENT AWS DEPLOYMENT PATH

EVIDENCE THAT CAN BE INSPECTED

103 automated tests passed. Domain arithmetic, extraction parsing, API access, recovery and saved history are covered. Frontend and Lambda builds passed. Software tests do not establish customer impact.

Live AWS workflow passed. Recovery and renewal; supplier acknowledgement; a later edit with historical responses retained; private historical evidence; closure and exports. PIN access does not independently verify supplier identity.

Five-image live OCR evaluation. 12 of 13 printed rows returned. One blank-quantity row was omitted; two units stayed unknown. The UI requires review against the whole invoice. This tiny synthetic set is not representative accuracy; failures are published.
